When you have a passion for technology and design, there is no limit to what you can accomplish.

I believe that by combining technology with design, we can come up with elegant and viable solutions to tackle the environmental challenges of the future, no matter how complex. I dream of a future where climate change, energy crisis and water shortage are no longer issues of the world, with sustainable development for the betterment of humanity.

Wong Shun Him
Victoria Junior College

It is my goal to improve the living conditions of the physically and mentally challenged because I believe that they deserve nothing less than what we have. With my love for all things physics, I strive to do so by creating products that can hopefully, disable disabilities.
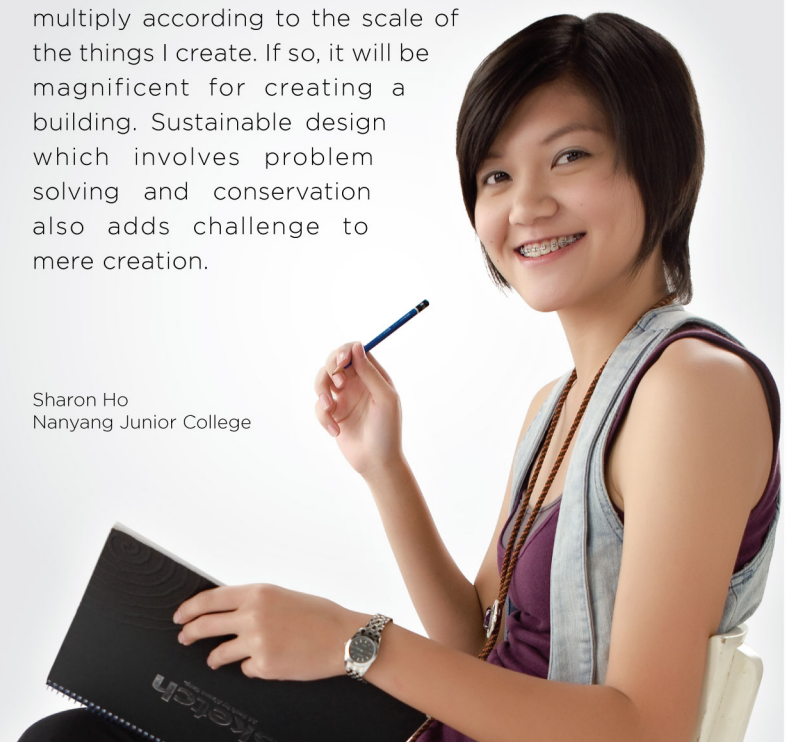

Ken Chua
Meridian Junior College

I love to work with my hands and understand what I'm creating. This is a common theme in my hobbies such as cooking, folding origami, tinkering with my LEGO NXT and gardening. I hope to take my passion for creating and use it to affect society.

Ng Jin Kai
Raffles Institution

I am very interested in architecture and sustainable design. I like creating things and it makes me wonder if the sense of satisfaction will multiply according to the scale of the things I create. If so, it will be magnificent for creating a building. Sustainable design which involves problem solving and conservation also adds challenge to mere creation.

Sharon Ho
Nanyang Junior College

Open for application: Now till 3 April 2011
Visit www.sutd.edu.sg to apply
